

## URL Schemes: Examples

These examples are based upon a URL Scheme Links project (URL\_Links.ppc) and a URL Scheme Target project (URL\_Target.ppc).

**Note:** In Apple iOS a session opened in the Target project via URL on the Links project when closed via 'Finish' will hold user on the Target project. In Android a session opened in the Target project via URL on the Links project when closed via 'Finish' will return user to the Links project. This contrasting behaviour reflects a difference in operating systems.

### New Session of URL Scheme Target

mds:///new/session?project=URL\_Target.ppc

### New Session - Transfer First Name

mds:///new/session?project=URL\_Target.ppc&values={"FirstName":"<%FirstName%>"}

### New Session - Transfer First and Last Name

mds:///new/session?project=URL\_Target.ppc&values={"FirstName":"<%FirstName%>","LastName":"<%LastName%>"}

### New Session - First Name set to John

mds:///new/session?project=URL\_Target.ppc&values={"FirstName":"John"}

### New Session of URL Scheme Links

mds:///new/session?project=URL\_Links.ppc

### ----- By GUID with Sessions in URL Scheme Target project -----

These examples are based upon the GUID/UUID of XML sessions which via XML Incoming should be imported and stored in the Data Window and sent to the URL Target project.
